

Otahuhu Recreation Centre

KlassikDrain KS100 with Type 492Q Grate

As part of a city wide amenities upgrade program Auckland City Council launched a \$30.9m project in 2013 to add a pool, aquatic centre and library to the existing recreation centre.

From the initial planning stage through to weeks before completion, ACO worked closely with designers and contractors to ensure the best and safest products were specified and installed.

Poolside drainage was required to remove any standing water splashed from the pool and ensure pedestrian safety throughout the complex. The corrosive nature of the chlorinated water meant a special solution was required.

Designers specified ACO's KS100 KlassikDrain with a custom 316 stainless steel edge rail to combat the corrosive water. Type 492Q composite Heelsafe® anti-slip grates were installed throughout the internal areas. These grates are perfect for applications where chemical corrosiveness is an issue, and provide complete safety for pedestrians in the area.
