

## Christchurch Airport

### Decorative Edged Rhinocast® Access Covers

As part of the expansion of Christchurch Airport's International Terminal, designers had multiple manholes that needed visually appealing covers.

ACO were engaged at the design stage to offer a manhole cover solution. To provide data and power to the new check in kiosks and information screens, specifiers required a number of pits throughout the international check in area of the new terminal.

These covers were required to provide a seamless floor finish and had to be capable of taking the 12mm floor tiles used in this area. This would require one of the many infill covers that ACO is able to offer.

Stainless steel edging was used to tie in to surrounding fittings and Rhinocast® class B access covers were chosen. With 12mm or 40mm decorative edges as standard, ACO manufactured a custom depth 25mm decorative edge to suit the needs for this application.

#### At a glance

##### Project

International check In area

##### Client:

Christchurch Airport

##### Brief:

To supply access covers able to take the surrounding tiles

##### Solution:

ACO's class B Rhinocast® access covers with custom 25mm stainless steel decorative edge
