Airports - The toughest test.

Airports provide the most punishing environments for drainage systems. Constant movement of very heavy loadings round the clock impose severe stresses on any product. Liquids used in de-icing can create both corrosion and EPA issues and have to be dealt with by the trench drain. Added to these are the ever present requirement for safety on airports that means only proven, reliable, quality products are used.

As the market leader, ACO has been involved in, and supplied, a variety of products worldwide. ACO has the most comprehensive range of products for trench drainage to suit every application and loading - for Runway or Terminal.
