## KerbDrain QK200B

### PORTFOLIO

#### Transmission Gully Wellington

For this infrastructure project in Wellington, ACO provided 200m of KerbDrain QK200B. The monolithic channel drain is made from durable polymer concrete and collects the surface water from the roundabout and traffic island, removing the risk of ponding to keep the roads safe. The intelligent design of the system transforms the kerb into vertical inlet slots with an underlying channel, where the runoff from the street is completely drained.

#### Benefits

- The access unit with aluminium lid allows easy access for maintenance.
- One-piece unit design for lifetime integrity and security.
- Profiled side walls and strengthening ribs provide channel strength and anchorage to surrounding concrete.
- Certified to AS 3996 Class D loading.
