

ACO Drain

SlabDrain H100K

PORTFOLIO

Auckland Art Gallery

The 2011 project to redevelop the Auckland Art Gallery sought to refurbish and strengthen the much loved building, increase the exhibition space by 75% and create terraces linking the spacious entrance forecourt to the nearby Albert Park. The high Kauri-like canopies allowed rain running into the forecourt and there was overspill from a featured fountain. To make sure that excess surface water did not enter the building, designers were required to provide adequate drainage. With the restricted depth of the site ACO's shallow depth SlabDrain was used to manage these constraints and provide an effective drainage solution.

Benefits

- ACO's SlabDrain H100K provides an aesthetic architectural finish, meeting the required depth restrictions.
- Stainless Steel grate with **Heelsafe**® Anti-Slip, providing a pedestrian friendly surface water management.
- The grate allows quick fitting and removal during installation and maintenance.
